## Query Features of Column-family database.

Query features of column-family database. It queries the database that the query languages. Column-family databases are supported by query languages. Such as a query languages. The language for traversing column-family database. It can traverse all the column family databases. It can be stored the events database such as name, events.

Row 1	column 1	column 2	column N
name: event1	event: login2	event: Atlas	

Row 2	column 1	column 2	column N
name: event1	event: login2	event: Atlas	

Column-family database also has the cypher query language (CQL) for querying the graph. outside query languages. column-family allows you to query database query to the column-family for the properties. of the nodes, traverse or navigate the

Properties of a node can be indexed using the indexing service. Similarly, properties of relationships or edges can be indexed, so, a node or edge can be found by the values. Indexes should be queried to find the starting node to begin a traversal query language.

Cassandra is a suitable and consistency of the oriented database. Cassandra can use some main companies such as Facebook, Twitter, eBay, Netflix and any more.

③. Consistency of the column-family database?

When a write is received by Cassandra, the data is first recorded in a commit log, then written to an in memory structure known as memtable.

A write operation is considered successful once it's written to the commit log and the memtable.

writes are batched in memory and periodically written out to structures known as SSTable. SSTables are not written to again after they are flushed. If there are changes to the data; a new SSTable is written. Unused SSTables are reclaimed by Compaction.

If we have a consistency setting of ONE as the default for all read operations, then when a read request is made, Cassandra returns the data from the first replica, even if the data is stale. If the data is stale, subsequent reads will get the latest (newest) data; this process is known as read repair. The low consistency level is good to use when you do not care if you get stale data and/or if you have high read performance requirements.

## ① Column-family database.

Column-family database store the data in Cassandra, Hbase, Hypertable, Amazon Hypertable, etc..., In Column-family database the data can be stored by mapped a keys, to the data values, that values was grouped as a multiple column-family database that map with key.

Cassandra is the main database in the column-family database it stores the data in keys that rows and also column of keys. It takes the data in accessed a column family that access a profile information but not the orders information.

Apache Casandar is a implementation, distribution,

base the data can be stored in a multiple database it becomes a write operation but doesnot get any point of failure. Cassandar is NoSQL database.

It access the read and write operation to handled a large amount of data in a scalable and doesnot get any point of failur.

The importance features of the column-family database are given below:

→ Cassandar is a suitable and consistency.

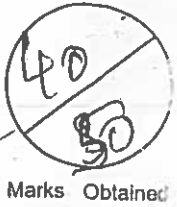

→ Cassandar is oriented database.

→ Cassandar stores the data by the AMOZON that doesnot get any point of failure.

→ Cassandar can store the data by using some main companies such as facebook, Twitter, ebay, Netflix and many more.

IA:- Column family Database :-

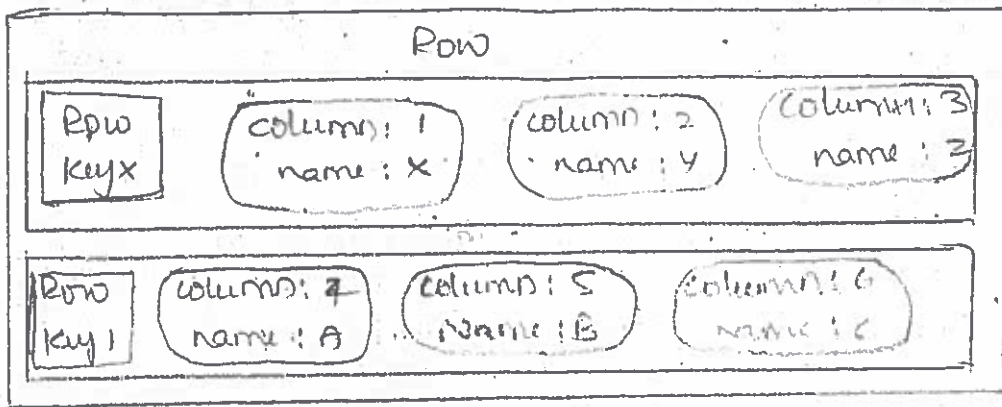

Column family database such<sup>as</sup> Cassandra, HBase, Hypeitable, Amazon Simple DB, allows to store the data in columns that are mapped with the values, values are grouped into multiple column families which are mapped as groups together with key rows.

Cassandra clusters keyspace column values ~~key~~ rows ~~sp~~ columns (are stored separately).

There are many column family databases. The column databases stores the data in rows that are grouped into multiple column that are associated by the rowkeys with the row-column values. The data in the column databases are related to each other which are grouped. For example ~~there~~ is customer profile information should be retrieved ~~by~~ ~~order~~. Data can be accessed at a time also.

Apache Cassandra is one of the most popular column database which is highly scalable, providing high-performance distributed database that can handle large amount of data in the systems and high availability with no single point of failure. It is data type of NoSQL.

Cassandra is fast and easy to performable in large databases also. The cluster does not allow master node, so read and write can be applicable to the nodes at any time.

\* It is cluster-tolerant fault.

\* Cassandra is easy and fast to access.

\* It is used by Amazon DB.

\* One of the best data type in NoSQL.

Cassandra can be used in large companies like Facebook, Twitter etc.

Q.A. - Consistency :-

When the write allowed to cassandra, the data written to its first replica of commit log, retrieved to in-memory structure called memtable.

The write operation can be written successful when it writes to commit log.

Write branched nodes and the structured of the nodes is called as SSTable. SSTable cannot. commit the nodes after flushed. <sup>In</sup> SSTable if the data is changed, then we need to access the new data again. The unused SSTable can be used by "compaction".

Cassandra by default consistency of setting is ONE for read operation. When the client gives read request, then the first replica is accessed if it contains stale data also. In

read operation if the first replica is stale data then we can take the

read operation can be failed. The low consistency level is used to the stale data without stale data it use high consistency level.

Same as write operation can be used to write the node in high consistency level at ONE replica. Write is node is lost, when the node gets down before the other node is going to write.

Quorums can be used for all the nodes to be read and write. The write nodes can get failed.

All consistency is used for the performance of read and write to involve in the column

database timestamps can be used to retrieve the data.

Keyspaces can be used for replicas, the number of nodes that can be accessed that are replication factor. There are only 3 replication factor which can be return as  $R+W > N$ . Consider a replication factor that can be written as  $R+2 > 3$ .

Hinted Handoff is used for the failures nodes

that are failed in read and write that can be retrieved by using Hinted Handoff.

## Advanced Query language :-

For indexing the data we use UPDATE command.

UPDATE COLUMN FAMILY CUSTOMER

## CQL query language :-

cassandra also have query language that is known as cassandra query language use SQL like commands.

SELECT customer (

key varchar PRIMARY KEY,  
name varchar, city varchar,  
web varchar)

INSERT INTO customer VALUES (name, city, web)

SELECT \* FROM customer

SELECT name, city FROM customer

SELECT name, city FROM customer WHERE web =

'www.maxin.com'

These are some commands used in CQL

CQL cannot supports all the commands like SQL

the SQL. It is not rich in query language.

#### 49. - Suitable cases :-

There are some suitable cases when the document database can be used in real-time applications.

##### 1) Event logging :-

Column family databases store the data structure in rows and column wise. This is used for the application of database to store the event information as rows and columns such as appname : timestamp. Event information can be encountered in the database.

##### 2) Content Management System or blogging application

In the blogging the content, comments, blogs and text everything can be stored as row.

The blogs can be stored in performance wise row-column wise that is based on the

uses who is blogging or inserting the blogs to
